

Commercial PSV case study

Commercial PSV, based in Essex, are specialists in fitting out new, or refurbishing, buses and other commercial vehicles.

Envirometal conducted extensive trials for commercial PSV and subsequently supplied a bespoke EcoTank dip tank for use with our air drying products. Parts are simply submerged in the product for 90 seconds and then allowed to air dry. The simple 90 second one step process cleans and pretreats ready for painting. Furthermore, once treated the process provides immediate protection against flash rust for upwards of 6 months before painting.

As it isn't heated they can turn it on and use it whenever they need. When it isn't being used it isn't costing anything at all. When it is on a small pump and a small fan are all the power it uses.

Envirometal Technologies' effective one step Plaforization™ process has improved quality, lowered costs and simplified Commercial PSV's pretreatment system.
